

Daily Work Report — Hope Hospital SEO

21 May 2026 · hopehospital.com · Prepared for Dr. B. K. Murali

Summary: Fixed several live accuracy/SEO issues, corrected the Google review data, strengthened the Ayushman (top growth) cluster, and built a complete 6-phase AI-assisted SEO automation system. All changes committed and pushed live.

1. Review Accuracy & Trust Fixes

- Corrected the star rating site-wide. The website's structured data claimed 4.5★ while Google actually shows 3.9★ — a mismatch that risked a Google penalty. Fixed across 24+ pages. → Removed penalty risk; honest snippets.
- Removed review schema from blog articles (against Google policy on articles). → Compliance risk cleared.
- Updated review count 399 → 402 as new patient reviews arrived (Google now shows 402). → Data stays accurate.

2. Cancer / Oncology Pages

- Fixed keyword cannibalization. Three cancer pages were competing for the same search. Re-targeted them: the oncology department page now owns "free cancer treatment in Nagpur"; the services page now targets "cancer surgery / surgical oncology". → Ranking signals consolidated.
- Corrected radiation-therapy wording to "by referral" (accuracy on a medical claim). → Trust / honesty.

3. Bugs Found & Fixed (by the new audit tool)

- Broken "Services" link (404 on all 9 service pages) — added a redirect. → Fixed.
- Stray "3.8/5" rating text on a blog page — corrected to 3.9. → Fixed.

4. Ayushman Bharat Cluster (Top Growth Driver)

- Found the Ayushman surgery-list page had only 1 incoming internal link despite being the #1 growth page. Added links from the homepage, the empanelments page, and the sibling Ayushman blog. → Inbound links 1 → 4; link equity now flows to the growth page.

5. Sitemap

- Auto-generated the sitemap from the real pages (49 URLs), fixed 2 trailing-slash issues, refreshed dates. → Always accurate, no manual editing.

6. Built: AI-Assisted SEO Operating System (main project)

A complete, modular system to manage SEO going forward — 6 phases, 10 commands, 7 engines — kept under seo-system/ (not on the public site).

Phase	Delivered
1 — Foundation	/daily-seo + audit engine (scans all 49 pages)
2 — Reporting	/weekly-report + GSC data reader (no API)
3 — GEO (AI search)	/geo-audit + /schema-generate
4 — Automation	auto-sitemap + one-command morning run
5 — AI workflows	/internal-link , /content-brief , /gbp-post

7. Google Business Profile

- Drafted replies for 3 new 5★ reviews (Suresh, Aarti, Shubham) — warm, distinct, no patient details. → Ready to post in GBP.

8. Documentation

- Created a full system documentation PDF explaining all phases, commands, and how it works.

Result & Status

- Technical audit now clean: 0 urgent issues (down from 10 found this morning).
- All work **committed and pushed to the live site** across the day.
- Google rating accurate at **3.9★ / 402 reviews** everywhere.

Next Steps

- Post the 3 GBP review replies.
- Run /daily-seo each morning; add a weekly Search Console export for real ranking data.
- In ~2 weeks, measure whether today's changes (esp. Ayushman links) improved rankings via /review-outcomes.
